

BUILD IN! PAYMENTS · MORPH L2

Ember.

Fund the future, one milestone at a time.

Milestone-based onchain crowdfunding · Built on Morph L2

Crowdfunding is broken — and backers pay for it

THE PROBLEM

Platforms like Kickstarter hand creators **100% of the funds upfront** — before a single promise is kept.

When the project stalls, **the backer eats the loss**. No recourse, no refund, no leverage.

Today

- Funds released on day one
- Trust sits with a platform
- Disputes settled by support tickets

The cost

- Broken promises, no accountability
- High fees on every transaction
- Worst in emerging markets that need it most

In Southeast Asia, the gap is widest

WHY HERE, WHY NOW

- The **Philippines** is among the world's leaders in **crypto-wallet adoption**.
- Millions already hold and move **USDT** for remittances and savings.
- A fast-growing **creator economy** and **SME** base — underserved by banks.
- Small businesses lack the **escrow, controls, and capital access** big institutions take for granted.

The infrastructure to fix this already exists onchain.

What's missing is a product that puts it in the hands of everyday creators and small businesses.

Ember

Onchain crowdfunding where funds release **as creators deliver — not before.**

What Ember does

THE SOLUTION

Backers contribute **USDT** into a project's own **escrow smart contract** and receive an **ERC-721 position NFT** as proof of stake.

Funds release to the creator **only when backers vote to approve each milestone.**

Trust-first

Cryptographic guarantees,
not platform promises.

Non-custodial — Ember
never holds your funds.

Algorithmic

Code decides fund
release. No human
discretion, no customer-
service-as-justice.

Stablecoin-native

USDT on Morph L2. No
volatile tokens on a
pledge. Low fees, fast
settlement.

How it works

FOUR STEPS, FULLY ONCHAIN

Step	What happens	Onchain
1 · Create	A verified org publishes a project with milestones	<code>ProjectFactory</code> deploys a dedicated escrow + NFT
2 · Back	Backers contribute USDT, mint a position NFT	<code>ProjectEscrow.contribute()</code>
3 · Vote	Each milestone is approved by weighted backer vote	<code>vote()</code> → <code>resolveMilestone()</code>
4 · Release	Funds release only for passed milestones	<code>claimMilestone()</code> → USDT to creator

A permissionless **keeper** resolves milestones when the voting window closes — no one can stall a payout.

Built and working — on Morph

DEMO · WHAT'S LIVE TODAY

- **Full flow deployed** to Morph Hoodi testnet
- Create → publish → back → vote → release, end to end
- Backer & org **dashboards**, in-app + email notifications
- **Admin panel**: org verification, audit logs, reports
- Project metadata + **NFT positions** served live

Live on testnet

A working product, not a whitepaper.

Web app, event indexer, and immutable contracts — all running together.

Under the hood

TECHNICAL EXECUTION

Contracts (Solidity + OZ v5)

- `ProjectFactory` — one **immutable** escrow + NFT per project
- `ProjectEscrow` — USDT custody, weighted voting, milestone release
- `PositionNFT` — transferable ERC-721 proof of stake
- **No upgrade key** — the rules can't change after deploy

Platform

- **Next.js 16** web app + REST API
- Standalone **indexer** mirrors every onchain event into Postgres
- **Keeper** auto-resolves milestones; **BullMQ** drives notifications
- Chain is the source of truth — UI reconciles to it

The track: tools big banks take for granted

BUILD IN! PAYMENTS — SME TRACK

Escrow. Programmatic fund control. Milestone-based disbursement. Auditable money flows.

These are the financial controls **large institutions** rely on. Ember puts them in the hands of a **small creator or SME** — with nothing but a wallet.

A baker, a hardware startup, a community project can now raise capital with the **same accountability guarantees** a bank gives a corporate client.

Why Ember wins

DIFFERENTIATION

	Funds held until delivery	Non - custodial	Onchain proof	Stablecoin
Kickstarter / GoGetFunding	✗	✗	✗	✗
Traditional escrow / banks	✓	✗	✗	✗
Generic crypto crowdfunding	⚠	✓	✓	⚠
Ember	✓	✓	✓	✓

Milestone escrow + weighted on-chain voting + position NFTs — accountability that neither Web2 platforms nor token launchpads offer.

The opportunity

MARKET

\$30B+

Annual remittances into the Philippines — a population already fluent in moving stablecoins

Top-ranked

Philippines among global leaders in crypto-wallet adoption

Millions

SMEs and creators across SEA underserved by traditional capital and escrow

Figures are directional, drawn from widely reported public data — sized to the wedge, not the world.

How Ember makes money

BUSINESS MODEL

- A **small platform fee** on each **milestone release** — we earn only when creators actually deliver.
- Revenue is **aligned with backers**: no delivery, no fee.
- **No token. No sale. No custody.** Pledges are utility, not securities.

Why it scales

Every project deploys its own escrow. Cost to serve is near-zero on **Morph L2**, so the model works at a **\$50 pledge** as well as a **\$50,000** one.

Roadmap

WHAT'S NEXT

Now

- Working demo on **Morph testnet**
- Core flow, dashboards, admin

Next

- **Mainnet** launch on Morph
- Fiat ↔ USDT **on-ramp** for non-crypto backers
- Org reputation & repeat-creator track record

Later

- Secondary market for **position NFTs**
- A **money layer** for **agentic AI** disbursement
- Cross-border SME financing rails

Build-in-public

HOW WE BUILT IT

- Shipped **end to end during the hackathon** — contracts, indexer, web app, admin.
- Documented architecture: **C4 diagrams** and **sequence flows** for every onchain interaction.
- Open, reviewable codebase with CI: lint, typecheck, tests, and a security checklist.
- Operations **runbook** for keeper rotation, backups, and incident response.

We didn't just demo a feature. We built something a real org could run.

EMBER · SECURED BY MORPH L2

Fund the future, one milestone at a time.

Crowdfunding that delivers.

Thank you — questions welcome.
